

CLAIMS

1) Method to perform a telecommunication between a caller terminal and a callee terminal identified by an identification code, such as a phone number, wherein it comprises the steps of:

- collecting routing information related to the identification code of the callee, after entering said code at the caller's terminal and before activating the telecommunication or establishing the telecommunication link;

- then displaying at least a part of said collected routing information at the caller's end, for example directly on the caller terminal;

- and finally either activating the telecommunication in order to establish the telecommunication link corresponding to the entered code or cancelling the current attempt to establish a telecommunication link based on said dialed code.

2) Method according to claim 1, wherein the concerned dialed telecommunication is activated by a further action performed on said caller terminal.

3) Method according to claim 2, wherein the concerned dialed telecommunication is activated by further pressing a determined key on the caller terminal.

4) Method according to claim 1, wherein the concerned dialed telecommunication is automatically activated after a given timeout following the dialing.

5) Method according to anyone of the claims 1 to 3, wherein the concerned dialed telecommunication is automatically cancelled in the absence of any further action performed on said caller terminal during a given time out after dialing.

6) Method according to anyone of the claims 1 to 5, wherein the information displayed at the caller's end only comprises information concerning the callee's end, such as the identification of the other end terminal which would be actually involved in establishing the telecommunication link if said dialed telecommunication is activated, or of the person to whom said other end terminal belongs.

7) Method according to anyone of the claims 1 to 5, wherein the information displayed at the caller's end comprises the identification of all the terminal(s) and/or other intermediate telecommunication device(s)

which would be involved in the telecommunication link if said dialed telecommunication is activated, and possibly their respective status and their mutual connections and relationships.

8) Telecommunication terminal comprising a visual and/or audio display means and adapted to perform the method according to anyone of claims 1 to 7.

9) Telecommunication system able to link together a plurality of telecommunication terminals according to claim 8, comprising one telecommunication network adapted for connection with one or several other telecommunication network(s), and managed by a corresponding network controller, wherein said telecommunication system is further adapted to perform the method according to anyone of claims 1 to 7.
